

WALKING AID

REMOD UG

CHALLENGE

- Small installation space within the control unit
- Easy handling due to self-explanatory connection technology
- Lightweight solution that does not negatively influence the movements

SOLUTION

- Completely assembled connector
- Color and mechanical coding
- Receptacle with PCB contacts (90° right-angled)
- Durable and lightweight plastic connector

CUSTOMER BENEFITS

- One contact person for the complete system
- Technical support and expertise
- Extended cable assembly experience

MEDICAL WALKING AID FOR POSTURE CORRECTION

ReMoD's walking aid is known from the TV show „Die Höhle der Löwen“. It is the first electronic biofeedback device, that supports patients with neurologically caused posture problems in controlling their posture and movements. The sensors mounted in the vest make it possible to detect body movements and incorrect posture. Electrodes attached to the body then use electrostimulation to ensure that the patient corrects his posture.

” In our requirement for a lightweight connector including a cable, we benefit from ODU's high vertical integration and competence in cable assembly.
